Chapter 23 Electric Current

MULTIPLE CHOICE. Choose the one alternative that best completes the statement or answers the question.

1) Just as in hydraulic circuits there is water pressure, in electric circuits there is					
A) current.	B) voltage.		C) resistance.		
2) Just as a sustained flow of water in	a hydraulic <mark>circuit</mark> r	needs a pump,	in electric circuits the flow	2)	
of charge needs					
A) current.	B) voltage.		C) resistance.		
3) A suitable electric pump in an electric				3)	
A) chemical battery.		generator.			
C) both of these	D) neither of the	ese		
4) It is correct to say that in electric circ				4)	
A) charge flows through a circui	t.				
B) flowing charge is current.					
C) voltage is applied across a cir					
D) voltage is the ratio of energy	per charge.				
E) all of the above					
-> 76.	.1.1. 11661		1 1 . 1		
5) If two copper wires of the same leng	,	iickness, then t		5)	
A) more resistance.	B) less resistance.		C) both the same		
6) Heat a copper wire and its electric r		1	C):	6)	
A) decreases.	B) remains uncha	nged.	C) increases.		
		ed 1 11 d	. 1	_\	
7) Two light bulbs are connected to a b	oattery, one at a time	e. The bulb tha	t draws <mark>more</mark> current has	7)	
the	toot				
A) lower resistance, and is brigh B) lower resistance, but is dimm					
C) higher resistance, and is brigh					
D) higher resistance, but is dimn					
E) none of the above	ilei.				
_,					
8) When you turn on a lamp, the initia	current in its filam	ent is greater a	at first, rather than a	8)	
moment later, which indicates		eric is Breater	at most man a		
A) something is faulty.					
B) a time delay for current attair	ning its average spec	ed.			
C) increased temperature means					
D) nothing of interest					
9) Ohm's law tells us that the amount	of current produced	l in a circuit is		9)	
A) directly proportional to volta	ge. B	3) inversely pro	portional to resistance.		
C) both of these) neither of the			

10) The voltage across a 10-ohm resis	stor carrying 5 A is	10)
A) 5 V.		
B) 10 V.		
C) 15 V.		
D) 20 V.		
E) more than 20 V.		
11) The resistance of a filament that c	carries 2 A when a 10-V potential difference across it is	11)
A) 2 ohms.	•	
B) 5 ohms.		
C) 10 ohms.		
D) 20 ohms.		
E) more than 20 ohms.		
12) Two lamps with different filamen	at thicknesses, and therefore different resistances, are connected	12)
in series. Greater current is in the	lamp with the	
A) thick filament.	B) thin filament. C) same in each	
13) If an electric toaster rated at 110 V	<i>I</i> is accidently plugged into a 220 –V outlet, the current drawn	13)
by the toaster will be		
A) half its normal value.	B) the same as its normal value.	
C) twice its normal value.	D) none of the above	
14) The current in two identical light	bulbs connected in series is 0.25 A. The voltage across both	14)
bulbs is 110 V. The resistance of a	single light bulb is	
A) 22 ohms.		
B) 44 ohms.		
C) 220 ohms.		
D) 440 ohms.		
E) none of the above		
15) Direct current is normally produc	ced by a	15)
A) battery.	B) generator.	
C) both of these	D) neither of these	
16) Current that is typically 60 hertz i	is	16)
A) direct current.	B) alternating current.	
C) either of these	D) neither of these	
17) A capacitor is useful in		17)
A) boosting the energy output	t of a circuit.	
B) increasing the current in a r		
C) smoothing pulsed current.		
D) changing dc to ac in a circu	nit.	
E) increasing or decreasing vo	oltage.	

A) storing electrical energy.B) boosting voltage.C) limiting current.	
C) limiting current.	
D) voltage modification.	
E) changing ac to dc.	
19) The source of electrons in a simple electric circuit is	
A) the voltage source.	
B) energy stored in the voltage source.	
C) energy released by the voltage source.	
D) the electrical circuit itself.	
E) none of the above	
20) The source of electrons that illuminate a common lamp in your home is	
A) the power company.	
B) the electrical outlet.	
C) atoms in the lamp filament.	
D) the wires leading to the lamp.	
E) the source voltage.	
21) The source of energy that illuminates a lamp in your home is 21)	
A) the power company.	
B) the electrical outlet.	
C) atoms in the bulb filament.	
D) the wire leads to the lamp.	
E) the source voltage.	
22) The cause of electrical shock is predominantly 22)	
22) The cause of electrical shock is predominantly A) excess current. B) excess voltage.	
A) excess current. B) excess voltage.	
· · · · · · · · · · · · · · · · · · ·	
A) excess current. B) excess voltage. C) reduced resistance. D) none of the above	
A) excess current. B) excess voltage. C) reduced resistance. D) none of the above	
A) excess current. C) reduced resistance. B) excess voltage. D) none of the above 23) Electrons flow in an electrical circuit by A) being bumped by other electrons.	
A) excess current. C) reduced resistance. B) excess voltage. D) none of the above 23) Electrons flow in an electrical circuit by A) being bumped by other electrons. B) colliding with molecules.	
A) excess current. C) reduced resistance. B) excess voltage. D) none of the above 23) Electrons flow in an electrical circuit by A) being bumped by other electrons. B) colliding with molecules. C) interacting with an established electric field.	
A) excess current. C) reduced resistance. B) excess voltage. D) none of the above 23) Electrons flow in an electrical circuit by A) being bumped by other electrons. B) colliding with molecules.	
A) excess current. C) reduced resistance. B) excess voltage. D) none of the above 23) Electrons flow in an electrical circuit by A) being bumped by other electrons. B) colliding with molecules. C) interacting with an established electric field. D) none of the above	
A) excess current. C) reduced resistance. B) excess voltage. D) none of the above 23) Electrons flow in an electrical circuit by A) being bumped by other electrons. B) colliding with molecules. C) interacting with an established electric field. D) none of the above 24) Although electrons in metal move in haphazard directions at many times the speed of sound, the	
A) excess current. C) reduced resistance. B) excess voltage. D) none of the above 23) Electrons flow in an electrical circuit by A) being bumped by other electrons. B) colliding with molecules. C) interacting with an established electric field. D) none of the above 24) Although electrons in metal move in haphazard directions at many times the speed of sound, the drift speed of electrons that compose electric current is	
A) excess current. C) reduced resistance. B) excess voltage. D) none of the above 23) Electrons flow in an electrical circuit by A) being bumped by other electrons. B) colliding with molecules. C) interacting with an established electric field. D) none of the above 24) Although electrons in metal move in haphazard directions at many times the speed of sound, the drift speed of electrons that compose electric current is A) a fraction of a centimeter per second.	
A) excess current. C) reduced resistance. B) excess voltage. D) none of the above 23) Electrons flow in an electrical circuit by A) being bumped by other electrons. B) colliding with molecules. C) interacting with an established electric field. D) none of the above 24) Although electrons in metal move in haphazard directions at many times the speed of sound, the drift speed of electrons that compose electric current is A) a fraction of a centimeter per second. B) many centimeters per second.	
A) excess current. C) reduced resistance. B) excess voltage. D) none of the above 23) Electrons flow in an electrical circuit by A) being bumped by other electrons. B) colliding with molecules. C) interacting with an established electric field. D) none of the above 24) Although electrons in metal move in haphazard directions at many times the speed of sound, the drift speed of electrons that compose electric current is A) a fraction of a centimeter per second.	

25) The electric field established by a battery in a dc circuit	25)
A) increases via the inverse-square law.	
B) changes magnitude and direction with time.	
C) acts in one direction.	
D) is non-existent.	
E) none of the above	
26) The electric field established by a generator in an ac circuit	26)
A) increases via the inverse–square law.	
B) changes magnitude and direction with time.	
C) acts in one direction.	
D) is non-existent.	
E) none of the above	
27) Power is defined as the energy expended per unit of time. When translated to electrical terms	ms, 27)
power is equal to	
A) current multiplied by resistance.	
B) current multiplied by voltage.	
C) current divided by time.	
D) voltage divided by time.	
E) none of the above	
28) One kilowatt-hour is a unit of	28)
A) energy.	
B) power.	
C) voltage.	
D) current.	
E) resistance.	
29) The electric power supplied to a lamp that carries 2 A at 120 V is	29)
A) 1/6 watts.	29)
B) 2 watts.	
C) 60 watts.	
D) 20 watts.	
E) 240 watts.	
E) 210 Wittis.	
30) A 100-W lamp glows brighter than a 25-W lamp. The electrical resistance of the 100-W lam	np is 30)
A) less. B) greater. C) the same.	ip is 50)
b) greater.	
31) A 60–W light bulb connected to a 120–V source draws a current of	31)
A) 0.25 A.	
B) 0.5 A.	
C) 2.0 A.	
D) 4.0 A.	
E) more than 4 A.	

32) A power line with a resistance of 2 of	ohms carrie	es a curre	nt of 80 A. The	e power dissipated in the	32)
line is					
A) 40 W.					
B) 160 W.	00 *	00	* •		
C) 320 W.	80 *	8U	_		
D) 12,800 W.					
E) none of the above					
,					
33) A 60-W and a 100-W light bulb are	connected	in series to	o a 120-V outl	et. Which bulb <mark>draws</mark> more	33)
current?					
A) 60-W bulb	B) 100-W	/ bulb		C) both the same.	
34) A heater draws 20A when connecte	d to a 110-	V line. If	the electric po	wer costs 20 cents per	34)
kilowatt hour, the cost of running th	ne heater fo	or 10 hour	rs is		
A) \$0.44.					
B) \$1.10.					
C) \$4.40.					
D) \$11.00.					
E) none of the above					
35) When two lamps are connected in s	eries to a b	attery, the	e electrical resi	istance that the battery	35)
senses is		•		Ž	
A) more than the resistance of ei	ther lamp.				
B) less than the resistance of eith	-				
C) none of these	•				
36) When a pair of identical lamps are of	connected i	n parallel	1		36)
A) voltage across each is the sam				ch is the same.	
C) power dissipated in each is the) all of the abo		
e, perver ansorpation in outer to the	ie suirie.	_	, 411 01 410 410 6		
37) On some early automobiles both he	adlighte fa	ilad whar	one bulb bur	nod out. The headlights	37)
were likely connected in	aungnis ia	neu wher	i one buib bui	ned out. The headinghts	<i></i>
•		D) normandiaul	24	
A) parallel.) perpendicula) basts	ar.	
C) series.		D) haste.		
38) Compared to a single lamp connecte	ad to a batt	tomi truo	identical lamn	a connected in carice to the	38)
same battery will carry	eu to a bati	tery, two	identicai iairip	s connected in series to the	36)
A) more current.	B) less cu	rront		C) the same current.	
A) mole current.	D) less ct	ment.		C) the same current.	
20) C 11 1 1 1	1 . 1			1: 111111	20)
39) Compared to a single lamp connect	ed to a bati	tery, two	iamps connect	ed in <i>parallel</i> to the same	39)
battery will carry	D) 1			G) 11	
A) more current.	B) less cu	irrent.		C) the same current.	
40) The(· ·	.1. 0 •			40\
40) The safety fuse in an electric circuit	is connecte	ea to the c	circuit in		40)
A) series.					
B) parallel.					
C) either series or parallel.					

41) The equivalent resistance of any parallel branch in a circuit is				
A) often less than the	resistance of the lowes	st resistor.		
B) always less than th	e resistance of the low	est resistor.		
C) usually half the val	ue of the lowest resist	or.		
D) none of the above				
42) When a pair of 1-ohm res	sistors are connected in	n <mark>series</mark> , their eau	ivalent (combined) resistance is	42)
2 ohms, and when connect		1	(/
A) ½ ohm.	•	f the above	C) also 2 ohms.	
43) The equivalent (combined	d) resistance of <mark>1</mark> -ohm	. <mark>2</mark> -ohm, and <mark>3</mark> -o	hm in <mark>series</mark> is about	43)
A) 1 ohm	B) 1.8 ohms.	C) 6 ohms.		
44) A 4-ohm and 6-ohm resis	stor connected in para	llel have an equiv	valent resistance of	44)
A) 2.4 ohms.	•	•		
B) 4 ohms.				
C) 5 ohms.				
D) 5.5 ohms.				
E) 10 ohms.
